Leveraging Data for Regulatory Decision Making

The NARUC Center for Partnerships & Innovation and U.S. Department of Energy Office of Electricity are co-hosting an interactive, members-only workshop on creating a data-supported decision-making environment at state utility commissions. The workshop will include limited presentations and ample time for peer-to-peer dialogue about the successes and challenges commissions are currently facing in receiving and using utility system data from companies to facilitate timely, data-informed decision making. When a commission requests data from a utility, do you get what you are expecting? Is it useful? Does it answer your questions? Are you able to analyze the data and synthesize insights across relevant proceedings? For many state decision-makers, it is difficult to define exactly what data are needed, in what format, and then what insights it can provide.

Attendees will learn about successful examples from other states while also sharing challenges that can be overcome. Insights from this session will be combined with other NARUC-DOE sessions throughout 2026 and anonymously included in a new DOE Voices of Experience summary of gaps and opportunities in leveraging electricity system data to support investment decisions. Registration is free and open to all commissioners and commission staff. Please [register in advance](#).

This event is not endorsed by MACRUC nor is it part of the official MACRUC agenda.
