

The Physical Infrastructure of Broadband Delivery

Monday, June 15

2:00 – 4:00

This NCTA-hosted site visit offers a practical look at what it takes to deploy, maintain, and upgrade high-speed broadband networks. Through a guided tour of a Spectrum Field Operations and Training facility and live demonstrations of fiber splicing, over-lashing, utility pole attachment, and installation, participants will see the skilled labor, coordination, and operational precision required to keep American telecommunications networks running. Transport (approx. 15 minutes) and refreshments are provided for this off-site operational overview. Contact Jorge Padilla at NCTA: jpadilla@NCTA.com.

This activity is not endorsed by MACRUC nor it is part of the official agenda.
